In our model we have used ResNet50 by using "from keras.applications import ResNet50". Through this it showed the model summary. As we have used Adam optimizer and we have done 10 epochs. After doing 10 epochs, we have seen the graph in where the validation and test are close . We have used 64 batch size and validation split was 0.2. I have uploaded the pictures from the drive. But unfortunately the camera didn't work at the end I have used a sample minimal program to use the camera but it didn't work either, but our program could perfectly detect whether someone is wearing mask or not someone.
